Summary

Motivated and detail-oriented Computer Science and Engineering graduate with knowledge of Python and C programming. Experienced in developing software projects, including an AI-powered chatbot, a Telegram bot, and an assistive smart stick for visually impaired people. Completed an internship in Flutter app development and passionate about learning new technologies, solving problems, and contributing to innovative software development projects. Eager to apply technical skills and grow professionally in a challenging IT environment.

Skills

Languages
Python, Java, JavaScript

Frontend
HTML, CSS, JavaScript, Bootstrap

Backend
Django

Databases
MySQL

DevOps and Tools
GitHub, VS code, Figma

Professional Experience

Full Stack Developer Intern 06/2026 – 12/2026 | Kochi,Kerala

- Worked as a Full Stack Developer Intern, gaining hands-on experience in designing, developing, and maintaining web applications.
- Assisted in frontend development using HTML, CSS, and JavaScript, and backend development using Python and Django.
- Gained practical knowledge of database management, debugging, and responsive web design while contributing to real-time projects.

.

Education

B Tech 10/2022 – 04/2026 | Trissur,India
Royal College Of Engineering and technology

Pursued a Bachelor of Technology in Computer Science and Engineering at Royal College of Engineering and Technology, Akkikavu (2022–2026). Gained foundational knowledge in programming, software development, computer systems, and problem-solving. Worked on academic projects involving Python, IoT, and application development.

Projects

Booknavs 09/2026 – 10/2026

Technologies and Tools Used:

- Frontend: HTML, CSS, JavaScript, and Bootstrap for designing responsive pages, navigation icons, buttons, and interactive elements.
- Backend: Python and Django framework for handling website functionality, user requests, authentication, and business logic.
- Database: Django database models for storing and managing book details, categories, prices, and user information. MySQL was explored using MySQL Workbench.
- Template Engine: Django Template Language (DTL) for displaying dynamic content and reusing layouts through `base.html` and template inheritance.

- Development Tools: Visual Studio Code for coding, Django development server for testing, and MySQL Workbench for database management.

Key Features Implemented:

- User registration, login, and logout.
- Home page with an attractive interface and navigation icons.
- Book categories and book listings.
- Individual book details, including descriptions and prices.
- Shopping cart functionality for managing selected books.
- Reusable page layouts using Django templates.
- Database-driven book information and category management.

Smart Stick with Ultrasonic Obstacle Detection 09/2025 – 05/2026

Developed a smart assistive walking stick designed to enhance the safety, mobility, and independence of visually impaired individuals. The system uses ultrasonic sensors to detect obstacles in the user's path by measuring the distance between the stick and nearby objects. When an obstacle is detected within a predefined range, the device provides alerts through a buzzer and vibration motor, enabling the user to identify potential hazards and navigate their surroundings more safely.
The project integrates embedded systems and sensor technology to provide real-time obstacle detection and alert mechanisms. It aims to reduce the risk of collisions with objects and improve the user's confidence while walking independently.

Technologies and Components Used:

- Ultrasonic Sensor (HC-SR04): Detects nearby obstacles by transmitting ultrasonic waves and measuring the time taken for the reflected waves to return.
- Arduino Microcontroller: Processes sensor readings and controls the alert mechanisms.
- Buzzer: Produces audible alerts when obstacles are detected.
- Vibration Motor: Provides tactile feedback to alert the user without relying solely on sound.
- Embedded C / Arduino IDE: Used for programming the microcontroller and implementing sensor-based obstacle detection.
- Power Supply: Provides the necessary power for the circuit and electronic components.

Key Features:

- Real-time obstacle detection using ultrasonic distance measurement.
- Audible and vibration-based alerts for nearby obstacles.
- Portable and user-friendly walking stick design.
- Supports safer navigation and independent mobility for visually impaired individuals.
- Low-cost assistive technology solution using readily available electronic components.

All In One Maintenance App 05/2025 – 08/2025

Developed an All-in-One Maintenance App, a centralized web-based application designed to simplify and organize maintenance activities. The application provides a user-friendly platform for managing maintenance requests, tracking service tasks, receiving task alerts, and generating maintenance reports. It aims to improve the efficiency of maintenance operations by organizing service-related information and providing easy access to maintenance records.

Technologies and Tools Used:

- Frontend: HTML, CSS, JavaScript – for designing the user interface and interactive web pages.
- Backend: Python and Django – for handling application logic, user requests, and maintenance operations.
- Database: SQLite / MySQL – for storing user details, maintenance requests, and service records (include the database you actually used).
- Development Tool: Visual Studio Code – for coding, debugging, and project development.

Key Features:

- Maintenance request management and service tracking.
- Task alerts and maintenance status updates.
- Maintenance report generation and record management.
- User-friendly interface for easy navigation.
- Centralized management of maintenance-related information.
